APRORESUME INTERACTIVE DIGITAL RESUME BUILDER

PROJECT REPORT

Student Name: Nandish Patel

Enrollment No: 241002047

Department: B.Tech C.E.

Class / Division: By

Subject: Anguler JS

Submitted To (Faculty Name): Riya Masaru

Academic Year: 2025–2026

College / Institute Name: ATMIYA University

ProResume: Interactive Digital Resume & Profile Builder

Project Report

1. Introduction

In today's digital era, resumes play a critical role in presenting a candidate's skills, education, and professional background to recruiters. Traditional methods of creating resumes using word processors can be time-consuming and often lead to formatting inconsistencies. To address this issue, web-based resume builders have emerged as efficient tools that allow users to create professional resumes quickly and easily.

This project, ProResume: Interactive Digital Resume & Profile Builder, is a web-based application developed using modern front-end technologies including HTML5, CSS3, and AngularJS. The application allows users to input their personal and professional details through an intuitive form interface while simultaneously generating a real-time resume preview.

The system is designed as a Single Page Application (SPA), meaning the entire application works within a single web page without reloading the browser. AngularJS manages data binding, routing, form validation, and dynamic user interface updates, significantly improving user experience and responsiveness.

2. Project Objectives

The primary objective of this project is to design and develop a responsive web application that simplifies the process of creating professional resumes.

Main objectives include:
• Develop a Single Page Application using AngularJS.
• Provide real-time resume preview while users enter data.
• Implement two-way data binding between form inputs and the resume template.
• Apply client-side form validation to ensure accurate data entry.
• Store user information using browser local storage.
• Demonstrate AngularJS routing without page reloads.
• Integrate an external API to fetch sample data.
• Create an attractive resume layout using CSS3.

3. Technologies Used

HTML5:
HTML5 structures the application including form fields, layout containers, and resume preview sections.

CSS3:
CSS3 is used for styling the application with modern layout techniques including Flexbox, grid layouts, and the CSS box model.

AngularJS:
AngularJS provides the framework for building the Single Page Application. It enables two-way data binding, controllers, directives, filters, and routing.

Angular Modules:
The application integrates several modules including ngRoute for navigation, ngAnimate for transitions, and ngStorage for local storage management.

Local Storage:
User profile information is stored in the browser's local storage so that entered data remains available even after refreshing the page.

API Integration:
The application fetches sample user data using the AngularJS $http service from a public API (JSONPlaceholder).

4. System Features

Dual Panel Interface:
The application contains a left panel for entering user details and a right panel for displaying a live resume preview.

Real-Time Validation:
AngularJS validation ensures correct input formats. Invalid entries are highlighted and helpful messages guide users to fix errors.

Skills Management:
Users can dynamically add, remove, and sort skills in the resume using AngularJS directives.

Custom Filter:
A custom filter called titleCase automatically formats text so that each word begins with a capital letter.

Custom Directive:
A reusable directive called currentTime displays the current date and time in the application.

Routing:
AngularJS routing enables navigation between different application views without reloading the page.

API Data Fetching:
Users can populate sample data automatically by clicking a button that retrieves user details from an external API.

5. Advantages

• Real-time resume preview improves editing efficiency.
• Data persistence using local storage prevents loss of information.
• Interactive UI improves user experience.
• Dynamic skill management makes resume editing flexible.
• Fast performance due to client-side SPA architecture.

6. Future Enhancements

Possible improvements for future versions include:

• Export resume as PDF or Word document.
• Provide multiple resume templates.
• Add profile photo upload functionality.
• Include education and work experience sections.
• Implement user login and cloud storage.
• Provide AI-based resume improvement suggestions.

7. Conclusion

The ProResume project demonstrates how modern client-side web technologies can be used to build interactive and efficient applications. By combining AngularJS features such as data binding, routing, directives, and filters with responsive HTML5 and CSS3 design, the application delivers a seamless resume creation experience.

The system allows users to quickly generate professional resumes while reducing formatting complexity. Overall, this project highlights the practical use of web technologies for building dynamic, user-friendly tools that improve productivity.
